

## Assignment 2

CLASSMATE  
Date \_\_\_\_\_  
Page \_\_\_\_\_

2.12.1

$$\$s0 = 0x80000000$$

$$\$s1 = 0xD0000000$$

add \$t0, \$s0, \$s1

$$\begin{array}{r} 0x \quad 80000000 \\ \quad \quad D0000000 \\ + \\ \hline \$t0 \text{ (Hex)} = \underline{150000000} \end{array}$$

Converting Hex  $\rightarrow$  Bin

2.12.2 As this is more than 32 bits it results in overflow.

2.12.3

sub \$t0, \$s0, \$s1

0x 8 000 0000  
0 0 000 0000

\$t0 = -5 000 0000

2.12.4

Converting from hex  $\rightarrow$  Bin

the ① 101 is the signed bit. & the above is 2's complement

NO OVER FLOW

2.12.5]

- A) add \$t0, \$s0, \$s1  
 B) add \$t0, \$t0, \$s0

A)

$$\begin{array}{r} 0x \quad 8 \quad 000 \quad 0000 \\ 0x \quad D \quad 000 \quad 0000 \\ + \\ \hline \$t0 = \quad 15 \quad 000 \quad 0000 \end{array}$$

B)

$$\begin{array}{r} 15 \quad 000 \quad 0000 \\ + \quad 8 \quad 000 \quad 0000 \\ \hline 1D \quad 000 \quad 0000 \end{array}$$

Overflow condition.

2.12.6]

Converting from Hex to Bin.

OVER FLOW Condition

0 0 0 0      0 0 | 0      0 0 0 1      0 0 0 0      1 0 0 0  
0 0 0 0      0 0 | 0      0 0 0 0      0 0 | 0      0 0 0 0 two

the above is R-type instruction.

B	B	B	B	B	B
31-26	25-21	20-16	15-11	10-6	5-0
↓	↓	↓	↓	↓	↓
Opcode	Reg. S	Reg. T	Reg. D	Shift amt	dec

Thus add \$50, \$50, \$50

2. 151

sw \$t1, 32(\$t2)

The above is T-type of instruction

sw = 0x2b

\$t1 = 9 = rt

\$t2 = 10 = rs

Immediate = 32

2.24)

Ans)

For Jump instruction

$$\text{JumpAddr} = \{ PC + 4 [31:28], \text{address}[26], 2^{16} \}$$

$$PC = 0x20000000$$

The max lower 26 bits of jump inst could be  $0x3FFFFFFF$

Shifted left by 3 bits to make it addressable

$$\cancel{0x3} 0xFFFFFC$$

$$\text{Now so Jump addr} = \{ 0x2, 0xFFFFFC \} \\ = 0x3FFFFFFC$$

So that is the max address. It can't reach  $0x40000000$

For branch instruction

$$\text{BranchAddr} = PC + 4 + \{ \text{immediate}[16], 2^{16} \}$$

And the limit of branch distance is  $2^{15}$  to  $2^{15}-1$

So it is not possible to use the heap to set OC to this address
